New firmware **GSM Support**

features: Firmware V2.12 in conjunction with hardware revision #710-2300-010 now supports reporting via GSM. The PCS300 can now report to a monitoring station with its on-board dialer through a standard landline or through a GSM network.

Parallel Reporting

With V2.12 of the PCS300, parallel reporting is now supported, whereas multiple reporting channels (IP, GPRS, and GSM) can now report to an IPR512 and to a standard landline monitoring station simultaneously. With previous versions of the PCS300, reporting was done in a sequential order, whereas only one reporting channel at a time was able to report.

Below is an example from the PCS300 Web Interface that shows the system configured for parallel IP, GPRS and GSM reporting.

Network Settings Receiver Settings Reporting Sequence Input Settings All

Reporting Sequence #1

Trigger

Telephone Number 10 / 32

Channels Sequence

Serial (sequential reporting)

Parallel (simultaneous reporting)

All report codes will be transmitted via the following channels simultaneously:

- Receiver 1 - IP
- Receiver 1 - GPRS
- GSM

Note: Landline reporting is not available in this mode. To enable or disable channels, go to [Receiver Settings](#)

GSM Telephone #

If using a GSM channel, you can set a different phone number to dial via GSM. By default it will use Trigger Telephone Number.

GSM Telephone Phone Number / 32

Hardware Landline reporting improved

Improvements: With hardware revision #710-2300-010 of the PCS300, it is no longer necessary to ground the PCS300 dialer in order to report to a monitoring station. With the previous hardware revision, the dialer of the PCS300 absolutely needed to be grounded in order to report.
